

Shubham Sharma

Full-Stack Web3 Engineer

thatcoderguyshubham@gmail.com — GitHub — LinkedIn — X

Full-stack Web3 engineer building Solana programs, TypeScript SDKs, backend infrastructure, and web and mobile applications. Experienced with Anchor, Pinocchio, LiteSVM, React, Bun, Redis, and PostgreSQL across privacy-focused products.

Web3 Experience

Working Group Member

Feb 2026 – May 2026

Turbin3 Pinocchio Working Group

- Implemented Enmarch's on-chain program layer in Rust and Pinocchio, including X-Wing public-key registration, message-root state, permission checks, and proof-backed updates.
- Built and tested secure account transitions and instruction validation while integrating the program with TypeScript SDKs, backend services, and web and mobile clients.
- Collaborated in a 3-member team to ship an end-to-end encrypted messaging product spanning Solana programs, reusable packages, backend infrastructure, and client applications.

Builder

Jul 2025 – Nov 2025

Turbin3 Builders Cohort

- Developed Solana programs for vaults, escrow, AMMs, staking, and Token-2022 transfer-hook patterns.
- Applied PDAs, CPIs, SPL token flows, signer and authority validation, account constraints, and secure state transitions using Anchor.
- Wrote integration tests using LiteSVM, Gill, Codama, and Chai.

Professional Experience

Full-Stack Engineer

Nov 2024 – May 2025

Cygnnet.One, Ahmedabad

- Developed and maintained client-facing features using React.js and .NET across production web applications.
- Worked with cross-functional teams to translate product requirements into responsive, maintainable UI flows and backend-integrated features.
- Diagnosed UI issues and improved reliability and usability across client projects.

Projects

Enmarch — Private Messaging on Solana

- Built a wallet-authenticated encrypted messaging platform with invite-based conversations, local key handling, and verifiable on-chain state updates.
- Implemented Rust and Pinocchio programs for X-Wing key registration, permissions, and message-root transitions, plus reusable TypeScript packages for encryption, Merkle trees, clients, and circuits.
- Built React 19 + Vite web and Expo/React Native Android clients with a Bun + Redis backend for challenge-response authentication, WebSocket relay, offline sync, deep-link invites, and ZK-verified root updates.

Veil — Private Recurring Payments on Solana

- Received a Superteam India Grant to build a privacy-preserving payroll protocol using Anchor, vault-based funding, Merkle recipient commitments, and MagicBlock Ephemeral Rollups for TEE-backed execution.
- Built a complete devnet implementation comprising an Anchor program, TypeScript SDK, Next.js dashboard, developer documentation, and a Node.js/Express coordinator backed by PostgreSQL and Drizzle ORM.
- Implemented schedule validation, due-execution monitoring, ER delegation, execution history, metrics, and SDK utilities for PDA derivation, Merkle proofs, and vault and schedule operations; submitted the project to the Colosseum Frontier Hackathon.

Technical Skills

- **Languages:** Rust, TypeScript, JavaScript, Go
- **Solana & Web3:** Solana, Pinocchio, Anchor, SPL Token, Token-2022, PDAs, CPIs, LiteSVM, Gill, Codama, Web3.js
- **Backend & Data:** Node.js, Bun, Express.js, PostgreSQL, Redis, MongoDB, MySQL, Drizzle ORM, WebSockets
- **Frontend & Infrastructure:** React.js, Next.js, React Native, Expo, Docker, Railway, Vercel
- **Privacy Systems:** Merkle trees, zero-knowledge proofs, local encryption

Education

Poornima Institute of Engineering and Technology

2020 – 2024 — CGPA: 8.82

Bachelor of Engineering in Computer Science
